

Azure DevOps Pipeline — Concepts

Basic se Advance: Pipeline ke andar kya hota hai

1) BASIC — Pipeline ka dhaancha (andar kya hota hai)

Pipeline — pura automation workflow

Stage — bada phase (Build / Scanning / Deploy)

Job — steps ka group; ek Agent par chalta hai

Step / Task — ek single command (jaise terraform init)

2) EXECUTION — Job kahaan aur kaise chalti hai

Rule: job ka apna pool pipeline-level pool ko OVERRIDE karta hai.
Manual Validation ka pool = server (agentless — kisi machine par nahi chalta).

3) ADVANCED — Pipeline ke extra controls

Trigger — pipeline kab chale (kis branch par)

Parallelism — bina dependency wale jobs ek saath

dependsOn — jobs/stages ka order set karna

Parameters — chalate waqt input (dev / prod)

Variables — andar set ki values (jaise workDir)

Conditions — shart sach ho tabhi chale (sirf main)

Manual Approval — production se pehle insaan ka final check
